RE: Hollow Brook Golf Club
2018 Annual Monitoring Report

Dear Mr. Preziosi:

In accordance with the Hollow Brook Golf Club (HBGC) Water Quality Monitoring Program, WSP is submitting the following 2018 Annual Monitoring Report. The purpose of the monitoring program is to provide data for measuring compliance with the May 2002 Environmental Management Plan (EMP), and to ensure that integrated pest management is functioning properly.

This report summarizes operational monitoring results for 2018. This monitoring program includes groundwater and surface-water sampling. Baseflow samples are to be collected twice per year in the summer and fall as per the June 2009 resolution by the Town of Cortland Planning Board (Resolution No. 23-09). Additionally, storm water samples are to be collected once per year. Course samples are analyzed for inorganic and organic compounds. The EMP requires that all compounds applied to the course in the previous 12 months be analyzed. Eurofins Eaton Analytical (Eurofins) of South Bend, Indiana has been instructed to report all compounds possible using the analytical methods which cover the applied compounds.

In February 2014, HBGC requested of the Town a modification to the EMP to reduce associated costs. The request was made in consideration of the monitoring results to date. In a March 30, 2016 letter from LBG (now WSP) to the Town, the following modifications were recommended: 1) eliminate surface water sampling at locations US-1 and SW-4; 2) eliminate groundwater sampling at Monitor Well GW-2; 3) discontinue analyses for volatile organic compounds, polycyclic aromatic compounds and metals; and, 4) the storm-sampling protocol outlined in the EMP will be followed until HBGC obtains an outside consultant to perform a new storm-water study. The 2018 sampling events followed these modifications, as will subsequent events.

1.0 SAMPLE DATES, LOCATIONS AND METHODOLOGIES

In 2018, two baseflow sampling events for groundwater and surface-water were conducted; August 6th and November 20th. A storm event was not conducted in 2018 due to either 1) individual precipitation event amounts and intensities did not meet the criteria described in the EMP, or 2) the timing of the precipitation event was not conducive to sampling during normal business hours.

wsp.com

During both the August 6th and November 20th baseflow events, samples from surface-water stations DS-1, SW-3, SW-5 and SW-6 (figure 1) were analyzed for inorganic compounds. In addition, samples from station DS-1 were analyzed for organic compounds (pesticides). Stations US-1 and SW-4 have been eliminated from the program as described in the preceding section. Groundwater samples from Monitor Wells GW-1R, GW-3 and GW-4 (figure 1) were analyzed for both organic and inorganic compounds. Well GW-2 is no longer sampled as described in the preceding section.

The samples were analyzed for the parameters listed in the EMP and included all pesticide compounds that have been applied in the previous 12 months. In addition, the Eurofins reports all additional compounds included in the applicable analytical methods. Inorganic parameters are analyzed by York Analytical Laboratories of Stratford, Connecticut. Field parameters, including pH, temperature, conductivity and dissolved oxygen are measured by WSP during sampling.

Laboratory results for pesticides are compared to New York State Standards and Guidance Values for groundwater and surface waters as described in the New York State Department of Environmental Conservation (NYSDEC) Guidance Memorandum: Division of Water Technical and Operational Guidance Series (1.1.1). Also, in accordance with the EMP, any detection of pesticides in course samples is evaluated for toxicological significance as indicated in the following table:

Sample Type	Toxicological Criteria as per EMP
Groundwater samples and Hollow Brook surface-water sample DS-1	50 percent of the respective EPA Health Advisory Level, abbreviated 50% HAL
Surface-water samples other than from the Hollow Brook (SW-3, SW-5 and SW-6)	10 percent of the Lethal Concentration in 50 percent of the simulated test population (fish, invertebrates), abbreviated 10% LC ₅₀

The analytical results for inorganic compounds are compared to NYS Standards and Guidance Values. According to the EMP, inorganics are also evaluated to determine if detections exhibit an increasing trend or exceed the baseline mean by two standard deviations (see EMP table 5.5).

2.0 SAMPLING RESULTS

The 2018 sampling results for groundwater and surface water are presented on tables 1 and 2. Historical results are included in previous Annual Monitoring Reports. The 2018 product application data and laboratory analytical reports are included in the Appendix.

2.1 Summer Groundwater and Baseflow Surface-Water Event

2.1.1 Groundwater

Laboratory analysis of the summer 2018 groundwater samples (table 1) shows that six pesticides were detected in the GW-1R sample, one pesticide was detected in the GW-3 sample and one pesticide was detected in the GW-4 sample. None of the detected compounds were at a concentration which exceeds the toxicological criteria.

GW-1R: Boscalid, chlorantraniliprole, paclobutrazol, propiconazole (isomer b), tebuconazole and triadimenol were detected in the GW-1R sample. Of these compounds, boscalid, chlorantraniliprole, paclobutrazol and tebuconazole were applied to the course during the 2018 season. Triadimenol is a metabolite of triadimefon, which was an applied compound during 2018. With the exception of

tebuconazole, all of these compounds were applied to the course at some point during the past five years, and all have previously been detected in the GW-1R samples. Tebuconazole was applied for the first time to the course on one occasion in May 2018.

GW-2: Sampling of groundwater from the GW-2 monitor well is no longer a part of the regular sampling protocol. The results of previous analyses of GW-2 samples are included in prior Annual Reports.

GW-3: The pesticide chlorantraniliprole, an applied compound, was detected in the GW-3 groundwater sample. This pesticide has not been detected in past GW-3 samples. The total dissolved solids (TDS) concentration in the groundwater sample from GW-3 was reported above the New York State Guidance Value (500 mg/l) at 543 mg/l. This exceedance is not considered a consequence of course activities.

GW-4: The pesticide chlorantraniliprole, an applied compound, was detected in the GW-4 groundwater sample. This compound has been detected in past GW-4 samples. The August 2018 concentration is similar to past detections.

2.1.2 Surface Water

Laboratory analysis of the summer 2018 surface-water sample DS-1 (table 1) shows that no pesticides were detected in the downstream Hollow Brook sample.

2.2 Fall Groundwater and Baseflow Surface-Water Event

2.2.1 Groundwater

Laboratory analysis of the fall 2018 groundwater samples (table 2) shows that six pesticides were detected in the GW-1R sample and 1 pesticide was detected in the GW-4 sample. No pesticides were detected in the GW-3 sample. None of the detected compounds were at a concentration which exceeds the toxicological criteria.

GW-1R: Chlorantraniliprole, paclobutrazol, propiconazole (isomers a), propiconazole (isomer b), tebuconazole and triadimenol were detected in the GW-1R sample. Of these compounds, chlorantraniliprole, paclobutrazol and tebuconazole were applied to the course during the 2018 season. Triadimenol is a metabolite of triadimefon, which was an applied compound during 2018. With the exception of tebuconazole, all of these compounds were applied to the course at some point during the past five years, and all have previously been detected in the GW-1R samples. Tebuconazole was applied for the first time to the course on one occasion in May 2018.

GW-2: Sampling of groundwater from the GW-2 monitor well is no longer a part of the regular sampling protocol.

GW-3: No pesticide compounds were reported by the laboratory above the Method Detection Limits (MDLs).

GW-4: The pesticide chlorantraniliprole, an applied compound, was detected in the GW-4 groundwater sample. This compound has been detected in past GW-4 samples. The November 2018 concentration is similar to past detections.

2.2.2 Surface Water

Laboratory analysis of the fall 2018 surface-water sample DS-1 (table 1) shows that no pesticides were detected in the downstream Hollow Brook sample.

3.0 DISCUSSION AND RESPONSES

3.1 Groundwater

Course groundwater samples continue to exhibit detections of applied pesticides. None of the 2018 pesticide detections were at concentrations which are considered toxicologically significant based on the criteria provided in the EMP (Tables 1 and 2). The 2018 groundwater detections were generally consistent with those of recent monitoring years with the exception of tebuconazole, which was applied for the first time to the course on one occasion in May 2018. Chlorantraniliprole was detected in the sample from GW-3 for the first time in the past five years during the August 2018 event; however, it was not detected during the November 2018 event.

Tebuconazole is a fungicide that has not been evaluated and approved for use on the course. The Superintendent, who is new as of last year, confirmed that it was used once in May 2018 to treat bunkers. The detected concentrations of 1.9 and 2.4 ug/l (micrograms per liter) are below the EPA Human Health Benchmark for Pesticides (HHBP) of 190 ug/l. An EPA Health Advisory Level (HAL), which is used to establish trigger levels for pesticides used on the course, does not exist for tebuconazole.

Chlorantraniliprole (Acelepryn) has been detected in groundwater every year since it was introduced at the course in 2011; however, it has never been detected in the Hollow Brook. It has been detected in the samples from GW-1R and GW-4 during each sampling event for the past three years. The detected concentrations during that time ranged from 0.07 and 0.54 micrograms per liter, which is well below the toxicologically significant trigger levels for groundwater and surface water of 5,530 and 1,380 micrograms per liter respectively. The detection in GW-3 is a new occurrence.

3.2 Surface Water

Only the DS-1 surface-water station is sampled during baseflow. The tributary surface water stations are sampled for inorganic criteria during baseflow but are sampled for organic pesticides only during storm events. The DS-1 station did not contain detectable levels of pesticides during the two 2018 sampling events.

3.3 Responses

The management response to detections of pesticides in HBCG groundwater or surface-water samples is described in Section 5.7.6 of the EMP. Restrictions described below for 2019 are based on 2018 detections.

Compound	Trade Name	Applied During 2018	Detected Above RT During 2018	2018 Operational Year (based on 2017 detections)	2019 Operational Year (based on 2018 detections)
2,4-D	Barrage, Formula 40, Opt-Amine, Weedar 64	N	N	No Restriction	No Restriction
Boscalid	Emerald	Y	Y	No Restriction	No Restriction
Chlorantraniliprole	Acelepryn	Y	Y	Spot application	Spot Application – Last Resort Chemical
Dithiopyr	28-0-3 W/Dimension	Y	N	No Restriction	No Restriction
Flutolanil	ProStar 70 WDG	Y	N	Spot application	No Restriction
Iprodione	Chipco 26-GT, Interface	Y	N	No Restriction	No Restriction

Compound	Trade Name	Applied During 2018	Detected Above RT During 2018	2018 Operational Year (based on 2017 detections)	2019 Operational Year (based on 2018 detections)
Pacllobutrazol	Trimmit 2 SC, PAC 223	Y	Y	Spot application	Spot Application
Pentachlorophenol (PCP)	(various)	N	N	No Restriction	No Restriction
Propiconazole	Banner Max	N	Y	Spot application	Spot application
Triadimenol	Bayleton Flo, Tartan (triadimefon)	N	Y	Spot application	Spot application
Tebuconazole	-----	Y	N	Not approved for Use	Not Approved for Use

In addition to the above we are making additional recommendations relative to tebuconazole and chlorantraniliprole.

Tebuconazole

The course has indicated that they would like to be able to use tebuconazole. In accordance with the Management Plan, new pesticides proposed for use on the course need to undergo a risk assessment and be approved by the Town. The course needs to make a formal request to use tebuconazole and then either the Town or the course needs to have a risk assessment completed by an approved professional before a determination can be made. In the interim, and for the reasons stated above, we cannot recommend continued use of this product at this time.

Chlorantraniliprole

If certain pesticides (specifically listed in the Management Plan) are detected below their respective trigger levels twice in the same year, their use is to be suspended. Chlorantraniliprole is not on that list as it was added after the fact in addition to several other pesticides. Because the new pesticides are not specifically addressed in the Management Plan, the Town and the course agreed that as long as any detections were below toxicologically significant levels and there were no detections in the Hollow Brook, the pesticide could continue to be used but had to be restricted to spot applications. In accordance with this protocol recommended management responses have been to restrict the use of chlorantraniliprole to spot applications. Further, in accordance with the original 2011 approval for the use of chlorantraniliprole by the Towns consulting agronomist, Dr. Martin Petrovic, this product is only to be used as a “last resort” after other products have failed to control the associated problem. In light of the ongoing detections, including the new detection in GW-3, we are recommending that the course complete the following additional actions to ensure chlorantraniliprole is being used as recommended:

- 1) Confirm whether or not chlorantraniliprole has been used as a last resort treatment in accordance with the February 2, 2011 Risk Assessment prepared A. Martin Petrovic.
- 2) Review other approved products to determine if there any with similar toxicological profiles that could be used instead. The Town understands that replacing this product with a less mobile but more toxic product may not be an appropriate response.

- 3) Provide any additional information that may help explain the regular occurrence of this product in the groundwater samples and present a plan for mitigating the occurrence of chlorantraniliprole if the course believes its continued use is the best option.

Kind regards,

WSP USA

Response Threshold as per Section 5.7.6 of the Management Plan.

NY Standard - New York State Water Quality Standard per 6 NYCRR Parts 700-705 (1) Class GA groundwater, (2) Class A, A-S, AA, AA-S surface water

50% HAL - 50% of the USEPA Health Advisory Limit. This is the toxicologically significant level for groundwater and surface water sample DS-1 in the absence of a State standard.

10% LC50 - 10% of the aquatic Lethal Concentration 50. This is the toxicologically significant level for surface water in the absence of a State standard

SS/ST/SD - State Standard or Statistically Significant Trend or Standard Deviation Exceedance

Any - Any detection triggers the Response Threshold

*Triadimenol is not applied but is a primary metabolite of triadimefon which is applied

< Indicates compound was not detected above the laboratory reportable limit

DO - Dissolved oxygen

TDS - Total Dissolved Solids

NM - Not measured

NA - Not analyzed

NS - No standard

N/A - Not applicable

uS/cm - Microseimens per centimeter

mg/l - Milligrams per liter

ug/l - Micrograms per liter

--- - None available

Exceedance of the RT

Exceedance of 50% HAL or NYS GWQS

Response Threshold as per Section 5.7.6 of the Management Plan.

NY Standard - New York State Water Quality Standard per 6 NYCRR Parts 700-705 (1) Class GA groundwater, (2) Class A, A-S, AA, AA-S surface water

50% HAL - 50% of the USEPA Health Advisory Limit. This is the toxicologically significant level for groundwater and surface water sample DS-1 in the absence of a State standard.

10% LC50 - 10% of the aquatic Lethal Concentration 50. This is the toxicologically significant level for surface water in the absence of a State standard

SS/ST/SD - State Standard or Statistically Significant Trend or Standard Deviation Exceedence

Any - Any detection triggers the Response Threshold

*Triadimenol is not applied but is a primary metabolite of triadimefon which is applied

< Indicates compound was not detected above the laboratory reportable limit

DO - Dissolved oxygen

TDS - Total Dissolved Solids

NM - Not measured

NA - Not analyzed

NS - No standard

N/A - Not applicable

uS/cm - Microseimens per centimeter

mg/l - Milligrams per liter

ug/l - Micrograms per liter

--- - None available

 Exceedance of the RT

 Exceedance of 50% HAL or NYS GWQS

Technical Report

prepared for:

WSP USA, Inc. (White Plains)
4 Westchester Park Drive, Suite 175
White Plains NY, 10604
Attention: Mike Defelice

Report Date: 08/13/2018

Client Project ID: 770503.HLBKGC Hollowbrook Golf Club
York Project (SDG) No.: 18H0242

CT Cert. No. PH-0723

New Jersey Cert. No. CT005 and NY037

New York Cert. Nos. 10854 and 12058

PA Cert. No. 68-04440

Report Date: 08/13/2018
Client Project ID: 770503.HLBKGC Hollowbrook Golf Club
York Project (SDG) No.: 18H0242

WSP USA, Inc. (White Plains)
4 Westchester Park Drive, Suite 175
White Plains NY, 10604
Attention: Mike Defelice

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on August 07, 2018 and listed below. The project was identified as your project: **770503.HLBKGC Hollowbrook Golf Club**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 18H0242

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Sample and Data Qualifiers Relating to This Work Order

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence . This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Report Summary

Project: Hollowbrook Golf Club (HBGC)

Note: In the Method L305 analysis, the reported MRL has been adjusted to reflect the method specific sample preparation procedure, which requires the injected sample composition to be 10% organic solvent and 90% field sample.

Client Name: WSP USA

Report #: 425157

Note: In the Method 515.3 analysis, the SS-2,4-Dichlorophenylacetic acid recoveries in the sample submitted for analysis for site GW-4 at 25 ug/L were low biased (66% and 68%, respectively) outside the acceptance limits of 70-130%.

Note: In the Method S150 analysis, the pyriproxyfen recovery in the LFB at 5.0 ug/L was low biased (92%) outside the acceptance limits of 95-130%.

Detailed quantitative results are presented on the following pages. The results presented relate only to the samples provided for analysis.

We appreciate the opportunity to provide you with this analysis. If you have any questions concerning this report, please do not hesitate to call Jessie Brasch at (574) 233-4777.

Lab Definitions

Continuing Calibration Check Standard (CCC) / Continuing Calibration Verification (CCV) / Initial Calibration Verification Standard (ICV) / Initial Performance Check (IPC) - is a standard containing one or more of the target analytes that is prepared from the same standards used to calibrate the instrument. This standard is used to verify the calibration curve at the beginning of each analytical sequence, and may also be analyzed throughout and at the end of the sequence. The concentration of continuing standards may be varied, when prescribed by the reference method, so that the range of the calibration curve is verified on a regular basis. CCL, CCM, and CCH are the CCC standards at low, mid, and high concentration levels, respectively.

Internal Standards (IS) - are pure compounds with properties similar to the analytes of interest, which are added to field samples or extracts, calibration standards, and quality control standards at a known concentration. They are used to measure the relative responses of the analytes of interest and surrogates in the sample, calibration standard or quality control standard.

Laboratory Duplicate (LD) - is a field sample aliquot taken from the same sample container in the laboratory and analyzed separately using identical procedures. Analysis of laboratory duplicates provides a measure of the precision of the laboratory procedures.

Laboratory Fortified Blank (LFB) / Laboratory Control Sample (LCS) - is an aliquot of reagent water to which known concentrations of the analytes of interest are added. The LFB is analyzed exactly the same as the field samples. LFBs are used to determine whether the method is in control. FBL, FBM, and FBH are the LFB samples at low, mid, and high concentration levels, respectively.

Laboratory Method Blank (LMB) / Laboratory Reagent Blank (LRB) - is a sample of reagent water included in the sample batch analyzed in the same way as the associated field samples. The LMB is used to determine if method analytes or other background contamination have been introduced during the preparation or analytical procedure. The LMB is analyzed exactly the same as the field samples.

Laboratory Trip Blank (LTB) / Field Reagent Blank (FRB) - is a sample of laboratory reagent water placed in a sample container in the laboratory and treated as a field sample, including storage, preservation, and all analytical procedures. The FRB/LTB container follows the collection bottles to and from the collection site, but the FRB/LTB is not opened at any time during the trip. The FRB/LTB is primarily a travel blank used to verify that the samples were not contaminated during shipment.

Matrix Spike Duplicate Sample (MSD) / Laboratory Fortified Sample Matrix Duplicate (LFSMD) - is a sample aliquot taken from the same field sample source as the Matrix Spike Sample to which known quantities of the analytes of interest are added in the laboratory. The MSD is analyzed exactly the same as the field samples. Analysis of the MSD provides a measure of the precision of the laboratory procedures in a specific matrix. SDL, SDM, and SDH / LFSMDL, LFSMDM, and LFSMDH are the MSD or LFSMD at low, mid, and high concentration levels, respectively.

Matrix Spike Sample (MS) / Laboratory Fortified Sample Matrix (LFSM) - is a sample aliquot taken from field sample source to which known quantities of the analytes of interest are added in the laboratory. The MS is analyzed exactly the same as the field samples. The purpose is to demonstrate recovery of the analytes from a sample matrix to determine if the specific matrix contributes bias to the analytical results. MSL, MSM, and MSH / LFSML, LFSMM, and LFSMH are the MS or LFSM at low, mid, and high concentration levels, respectively.

Quality Control Standard (QCS) / Second Source Calibration Verification (SSCV) - is a solution containing known concentrations of the analytes of interest prepared from a source different from the source of the calibration standards. The solution is obtained from a second manufacturer or lot if the lot can be demonstrated by the manufacturer as prepared independently from other lots. The QCS sample is analyzed using the same procedures as field samples. The QCS is used as a check on the calibration standards used in the method on a routine basis.

Reporting Limit Check (RLC) / Initial Calibration Check Standard (ICCS) - is a procedural standard that is analyzed each day to evaluate instrument performance at or below the minimum reporting limit (MRL).

Surrogate Standard (SS) / Surrogate Analyte (SUR) - is a pure compound with properties similar to the analytes of interest, which is highly unlikely to be found in any field sample, that is added to the field samples, calibration standards, blanks and quality control standards before sample preparation. The SS is used to evaluate the efficiency of the sample preparation process.

Endrin aldehyde	17.244	3481	0.0000	879	236
4,4'-DDT	17.992	592549	2.1079	970	865
Endrin ketone	18.989	8980	2.3082	859	258
Benzo[a]anthracene	19.071	238111	1.8108	998	998
Chrysene	19.169	279271	1.9236	999	970
Benzo(a)pyrene	22.166	3720	6.0896	793	172

Phenanthrene / Anthracene Resolution:

$$R = (1.18(RT_2 - RT_1)) / (W_1 + W_2)$$

$$R = 2.36$$

Benzo[a]anthracene / Chrysene Resolution:

$$R = (1.18(RT_2 - RT_1)) / (W_1 + W_2)$$

$$R = 1.86$$

DDT Breakdown:

$$\text{Breakdown} = \frac{100 * (\text{DDD} + \text{DDE})}{(\text{DDT} + \text{DDD} + \text{DDE})}$$

$$\text{Breakdown} = 1.29 \quad \text{PASS}$$

Endrin Breakdown:

$$\text{Breakdown} = \frac{100 * (\text{EK} + \text{EA})}{(\text{Endrin} + \text{EK} + \text{EA})}$$

$$\text{Breakdown} = 2.94 \quad \text{PASS}$$

RT= Retention time in minutes

W= Peak Width at 1/2 height in minutes

R is baseline resolved when R>1.5

Breakdown must be less than 30%

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on November 21, 2018 and listed below. The project was identified as your project: **770503.HLBKGC.00**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 18K0859

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Sample and Data Qualifiers Relating to This Work Order

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence . This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

LABORATORY CASE NARRATIVE

Client: WSP USA

Report #: 436672QC

All method QC was within acceptance limits, with the exception of:

515.3

The SS-2,4-Dichlorophenylacetic acid recoveries in the sample submitted for analysis for site GW-4 at 25 ug/L were low biased (31% and 36%, respectively) outside the acceptance limits of 70-130%.

The bentazon recovery in the CCC at 1.0 ug/L was high biased (151%) outside the acceptance limits of 70-130%.

The 2,4-DB, acifluorfen, bentazon, chloramben, DCPA acid metabolites and dichlorprop recoveries in the CCC at 3.0 ug/L were high biased outside the acceptance limits of 70-130%.

S150

The pyriproxyfen and thiobencarb recoveries in the LFB at 5.0 ug/L were low biased (94% and 69%, respectively) outside their respective acceptance limits.

Note: In the Method L305 analysis, the reported MRL has been adjusted to reflect the method specific sample preparation procedure, which requires the injected sample composition to be 10% organic solvent and 90% field sample.

Report Summary

Note: See attached page for additional comments.

Client Name: WSP USA

Report #: 436672

Detailed quantitative results are presented on the following pages. The results presented relate only to the samples provided for analysis.

We appreciate the opportunity to provide you with this analysis. If you have any questions concerning this report, please do not hesitate to call Jessie Brasch at (574) 233-4777.

Note: This report may not be reproduced, except in full, without written approval from EEA.

Lab Definitions

Continuing Calibration Check Standard (CCC) / Continuing Calibration Verification (CCV) / Initial Calibration Verification Standard (ICV) / Initial Performance Check (IPC) - is a standard containing one or more of the target analytes that is prepared from the same standards used to calibrate the instrument. This standard is used to verify the calibration curve at the beginning of each analytical sequence, and may also be analyzed throughout and at the end of the sequence. The concentration of continuing standards may be varied, when prescribed by the reference method, so that the range of the calibration curve is verified on a regular basis. CCL, CCM, and CCH are the CCC standards at low, mid, and high concentration levels, respectively.

Internal Standards (IS) - are pure compounds with properties similar to the analytes of interest, which are added to field samples or extracts, calibration standards, and quality control standards at a known concentration. They are used to measure the relative responses of the analytes of interest and surrogates in the sample, calibration standard or quality control standard.

Laboratory Duplicate (LD) - is a field sample aliquot taken from the same sample container in the laboratory and analyzed separately using identical procedures. Analysis of laboratory duplicates provides a measure of the precision of the laboratory procedures.

Laboratory Fortified Blank (LFB) / Laboratory Control Sample (LCS) - is an aliquot of reagent water to which known concentrations of the analytes of interest are added. The LFB is analyzed exactly the same as the field samples. LFBs are used to determine whether the method is in control. FBL, FBM, and FBH are the LFB samples at low, mid, and high concentration levels, respectively.

Laboratory Method Blank (LMB) / Laboratory Reagent Blank (LRB) - is a sample of reagent water included in the sample batch analyzed in the same way as the associated field samples. The LMB is used to determine if method analytes or other background contamination have been introduced during the preparation or analytical procedure. The LMB is analyzed exactly the same as the field samples.

Laboratory Trip Blank (LTB) / Field Reagent Blank (FRB) - is a sample of laboratory reagent water placed in a sample container in the laboratory and treated as a field sample, including storage, preservation, and all analytical procedures. The FRB/LTB container follows the collection bottles to and from the collection site, but the FRB/LTB is not opened at any time during the trip. The FRB/LTB is primarily a travel blank used to verify that the samples were not contaminated during shipment.

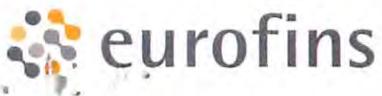

Matrix Spike Duplicate Sample (MSD) / Laboratory Fortified Sample Matrix Duplicate (LFSMD) - is a sample aliquot taken from the same field sample source as the Matrix Spike Sample to which known quantities of the analytes of interest are added in the laboratory. The MSD is analyzed exactly the same as the field samples. Analysis of the MSD provides a measure of the precision of the laboratory procedures in a specific matrix. SDL, SDM, and SDH / LFSMDL, LFSMDM, and LFSMDH are the MSD or LFSMD at low, mid, and high concentration levels, respectively.

Matrix Spike Sample (MS) / Laboratory Fortified Sample Matrix (LFSM) - is a sample aliquot taken from field sample source to which known quantities of the analytes of interest are added in the laboratory. The MS is analyzed exactly the same as the field samples. The purpose is to demonstrate recovery of the analytes from a sample matrix to determine if the specific matrix contributes bias to the analytical results. MSL, MSM, and MSH / LFSML, LFSMM, and LFSMH are the MS or LFSM at low, mid, and high concentration levels, respectively.

Quality Control Standard (QCS) / Second Source Calibration Verification (SSCV) - is a solution containing known concentrations of the analytes of interest prepared from a source different from the source of the calibration standards. The solution is obtained from a second manufacturer or lot if the lot can be demonstrated by the manufacturer as prepared independently from other lots. The QCS sample is analyzed using the same procedures as field samples. The QCS is used as a check on the calibration standards used in the method on a routine basis.

Reporting Limit Check (RLC) / Initial Calibration Check Standard (ICCS) - is a procedural standard that is analyzed each day to evaluate instrument performance at or below the minimum reporting limit (MRL).

Surrogate Standard (SS) / Surrogate Analyte (SUR) - is a pure compound with properties similar to the analytes of interest, which is highly unlikely to be found in any field sample, that is added to the field samples, calibration standards, blanks and quality control standards before sample preparation. The SS is used to evaluate the efficiency of the sample preparation process.

Benzo(a)pyrene	21.915	1506	2.1116	670	124

Phenanthrene / Anthracene Resolution:

$$R = (1.10(RT2-RT1))/(W1+W2)$$

R = 1.02

Benz[a]anthracene / Chrysene Resolution:

$$R = (1.10(RT2-RT1))/(W1+W2)$$

R = 1.73

DDT Breakdown:

$$\text{Breakdown} = \frac{100 * (\text{DDD} + \text{DDT})}{(\text{DDT} + \text{DDD} + \text{DDE})}$$

Breakdown = 5.86 PASS

Endrin Breakdown:

$$\text{Breakdown} = \frac{100 * (\text{EK} + \text{EA})}{(\text{Endrin} + \text{EK} + \text{EA})}$$

Breakdown = 6.08 PASS

RT= Retention time in minutes

W= Peak Width at 1/2 height in minutes

R is baseline resolved when R>1.5

Breakdown must be less than 30%
